

## **Cellular Regeneration**

It takes 28 days for a new skin cell produced in a 20 year old individual to rise to the surface, but it takes 90 days for the same to occur in a 50 year old. This slowing of the skin regeneration process allows for more time to dry-out the skin and create signs of the aging process. You can speed up the Cellular Turnover with Derma-Ceutix Products and customized treatments with your local Esthetician.
