

What is the pH of Skin?

It might surprise you to find out that skin's surface and uppermost layers are naturally acidic, making it compatible with acidic skin care products. The acid-alkaline balance of the skin, measured as the pH level, is the key to excellent skin care. The pH of the skin is acidic and measured roughly to be 4.5 during the night (at sleep) and then upwards of 5.5 during the day. Derma-Ceutix products are made to penetrate into the skin to work and help achieve your skin care goals!
